

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims

1 **Claim 1 (currently amended):** An electronic apparatus
2 comprising:
3 a frame member attached to a front part of an
4 apparatus body;
5 a movable member accommodated inside the frame member;
6 and
7 driving means for moving the movable member,
8 wherein the movable member is rotated around a first
9 shaft, and
10 wherein an initial movement from an accommodation
11 position inside the frame member of the movable member by
12 the driving means has a movement component in a forward
13 direction with respect to the apparatus body at a position
14 of the first shaft and a position of a front end of the
15 movable member, which is at an opposite end and side to the
16 first shaft.

1 **Claim 2 (currently amended):** The electronic apparatus
2 according to claim 1,

3 wherein the first shaft and the front end of the
4 movable member initially move in parallel each other, when
5 the movable member moves from ~~[[an]]~~the accommodation
6 position.

1 **Claim 3 (original):** The electronic apparatus
2 according to claim 1,

3 wherein the driving means includes a sliding member
4 for moving a lower part of the movable member in forward
5 and backward directions, and

6 the first shaft is rotatably coupled to the sliding
7 member.

1 **Claim 4 (original):** The electronic apparatus
2 according to claim 1,

3 wherein the movable member has a second shaft in both
4 side portions, and

5 the frame member has a guide groove for slidably
6 guiding the second shaft.

1 **Claim 5 (original):** The electronic apparatus
2 according to claim 4, further comprising:

3 energizing means for forward energizing the second
4 shaft side of the movable member in the accommodation
5 position.

1 **Claim 6 (original):** The electronic apparatus
2 according to claim 5,
3 wherein the energizing means is a spring member.

1 **Claim 7 (original):** The electronic apparatus
2 according to claim 4,
3 wherein the guide groove has an upper end for guiding
4 the second shaft in a forward direction with respect to the
5 apparatus body.

1 **Claim 8 (original):** The electronic apparatus
2 according to claim 1,
3 wherein the driving means includes a sliding member
4 for moving a lower part of the movable member in forward
5 and backward directions,
6 the first shaft is rotatably coupled to the sliding
7 member,
8 the movable member has a second shaft in both side
9 portions,
10 the frame member has a guide groove for slidably
11 guiding the second shaft, and
12 the front end of the movable member, the second shaft,
13 and the first shaft are positioned from a forward side to
14 a rearward side of the apparatus body in this order.

1 **Claim 9 (original):** The electronic apparatus
2 according to claim 1,
3 wherein the movable member has a projection,
4 the frame member has a guide groove in a position
5 corresponding to the projection of an internal wall
6 surface, and
7 the projection is inserted into the guide groove when
8 the movable member comes to be accommodated.

1 **Claim 10 (original):** The electronic apparatus
2 according to claim 9, further comprising:
3 a rubber pad on an opposed surface of the guide
4 groove.

1 **Claim 11 (currently amended):** A movable member
2 driving method in an electronic apparatus comprising a
3 frame member attached to a front part of an apparatus body,
4 a movable member accommodated inside the frame member to be
5 rotated around a first shaft, and driving means for moving
6 the movable member, when the movable member moves from an
7 accommodation position inside the frame member, comprising
8 the steps of:

9 moving the first shaft and a front end of the movable
10 member, which is at an opposite end and side to the first
11 shaft, ~~of the movable member~~ in a forward direction with
12 respect to the front part of the apparatus body; and
13 rotating the movable member around the first shaft.

1 **Claim 12 (original):** A movable member positioning
2 method in an electronic apparatus comprising a frame member
3 attached to a front part of an apparatus body, a movable
4 member accommodated inside the frame member to be rotated
5 around a first shaft, and driving means for moving the
6 movable member, with using a jig having parallel protruded
7 pieces to abut on an inside surface of the frame member,
8 comprising the steps of:

9 inserting the protruded pieces of the jig into the
10 frame member from a front of the frame member;

11 inserting the apparatus body including the movable
12 member between the protruded pieces from a rear of the
13 frame member;

14 positioning the movable member with respect to the
15 frame member; and

16 fixing the apparatus body and the frame member.

1 **Claim 13 (currently amended):** An electronic apparatus
2 comprising:

3 a frame member attached to a front part of an
4 apparatus body;

5 a movable member movably supported on an inside of the
6 frame member; and

7 driving means for driving the movable member,

8 wherein the movable member is rotated while a lower
9 part of the movable member moves in forward and backward
10 directions of the apparatus body by a driving operation of
11 the driving means to open and close the front part of the
12 apparatus body, and

13 an upper end is displaced in only a downward direction
14 in a vertical direction of the apparatus body when the
15 movable member in the most erected state is rotated,

16 wherein a rotating shaft of the movable member is
17 positioned in the same place as a top of an upper end of a
18 front surface of the movable member or is positioned
19 forward therefrom in the forward and backward directions of
20 the apparatus body in a condition when the movable member
21 is set in the most erected state.

1 **Claim 14 (currently amended):** The electronic
2 apparatus according to claim 13,

3 wherein the movable member has a sliding shaft
4 provided on an upper side of both side portions, and [[a]]

5 the rotating shaft provided on a lower side of the both
6 side portions,

7 the frame member has a guide groove to be inserted the
8 sliding shaft of the movable member and guiding the sliding
9 shaft, and

10 the driving means includes a sliding member coupled to
11 the rotating shaft of the movable member and driving the
12 rotating shaft in the forward and backward directions of
13 the apparatus body.

Claim 15 (canceled)

1 **Claim 16 (currently amended):** An electronic apparatus
2 comprising:

3 a frame member attached to a front part of an
4 apparatus body;

5 a movable member accommodated in the frame member; and
6 driving means for moving the movable member,

7 wherein the movable member is rotated around a first
8 shaft,

9 the movable member moves by a driving operation of the
10 driving means from a position where the movable member is
11 accommodated in a forward direction with respect to the
12 apparatus body in a position of the first shaft,

13 wherein the rotating shaft of the movable member is
14 positioned in the same place as a top of an upper end of a

15 front surface of the movable member or is positioned
16 forward therefrom in the forward and backward directions of
17 the apparatus body in a condition when the movable member
18 is set in the most erected state, and

19 a component in a direction orthogonal to the forward
20 direction in a position of a front end which is opposite to
21 the first shaft is set in a direction of the first shaft
22 side.

1 **Claim 17 (original):** The electronic apparatus
2 according to claim 16,

3 wherein the driving means includes a sliding member
4 for moving a lower part of the apparatus body in forward
5 and backward directions, and

6 the first shaft is rotatably coupled to the sliding
7 member.

1 **Claim 18 (original):** The electronic apparatus
2 according to claim 16,

3 wherein the movable member has a second shaft in both
4 side portions, and

5 the frame member has a guide groove for slidably
6 guiding the second shaft.

1 **Claim 19 (original):** The electronic apparatus
2 according to claim 16,
3 wherein the driving means includes a sliding member
4 for moving a lower part of the apparatus body in forward
5 and backward directions,
6 the first shaft is rotatably coupled to the sliding
7 member,
8 the movable member has a second shaft in both side
9 portions,
10 the frame member has a guide groove for slidably
11 guiding the second shaft, and
12 the first shaft, the front end of the movable member,
13 and the second shaft are positioned from a forward side to
14 a rearward side of the apparatus body in this order.
